	Cora (Node)	NCI1 (Graph)	Epinions(Link)
Instructions	I have a dataset $\mathcal{D}$ which is a citation network like Cora dataset. In this network, the nodes $\cdots$ and the edge $\cdots$. My goal is to accurately predict the domains of these papers.	I have a dataset $\mathcal{D}$, like NCI1 dataset in graph benchmark, and each graph is a chemical compounds. I want to find one GNN that has better accuracy when predicting the molecule property.	I currently possess a social network dataset like Epinions, denoted as $\mathcal{D}$. In this dataset, the nodes $\cdots$, and edges $\cdots$. My objective is to recommend potential friends for each user.
Prompted output of manager agent	$\mathcal{D}$: citation network Cora; $\mathcal{T}$: node classification; Evaluation metric $\mathcal{M}$: accuracy. $\cdots$	$\mathcal{D}$: chemical compounds NCI1; $\mathcal{T}$: graph classification; Evaluation metric $\mathcal{M}$: accuracy. $\cdots$	$\mathcal{D}$: social network Epinions; $\mathcal{T}$: link prediction; Evaluation metric $\mathcal{M}$: Recall@20. $\cdots$
Formatted output of configuration agent	The response list is ['Aggregation','Selection','Fusion']	The response list is ['Aggregation', 'Pooling', 'Readout','Selection','Fusion']	The response list is ['Embedding dim', 'Message function', $\cdots$, 'Layer combination', 'Interaction function']
