

Thought: First, I need to check if the input file is ready. The input file should contain the SSH configuration from the RHEL host. If not, I need to create an Ansible playbook to collect the configuration and run it.

Action: using tool

GeneratePlaybookTool

Input: {"sentence":
"Collect SSH configuration from RHEL
host", "playbook_file":
"/tmp/agent/20250127171917/playbook.yml"}

...Successfully generate playbook...

Thought: Now that I have the configuration collected, I need to generate the OPA Rego policy to check if the SSH LoginGraceTime is set to one minute or less.

Action: using tool

GenerateOPAREgoTool

Input: {"sentence":
"Check if SSH LoginGraceTime is set to one
minute or less", ...

Observation:

The generated policy is below:

...

```
result := false if {  
  not contains(input, "LoginGraceTime 1m") and  
  not contains(input, "LoginGraceTime 0m")
```

Thought: Now that I have the OPA Rego policy and input file ready, I can run the policy check.

Action: using tool

RunOPAREgoTool

Input: {"policy_file":
"/tmp/agent/20250127171917/policy.rego",
"input_file": "/tmp/agent/20250127171917/co
llected_data.json"}

Observation:

I encountered an error while trying to use the tool.

This was the error: **failed to run `opa eval`
command**; error details:

STDOUT: ...

```
not contains(input, "LoginGraceTime 1m") and not  
contains(input, "LoginGraceTime 0m"),...
```

...Repeating the same failures...

**After maximum retry limit, report the currently
filepaths that are created in the previous task.**
