

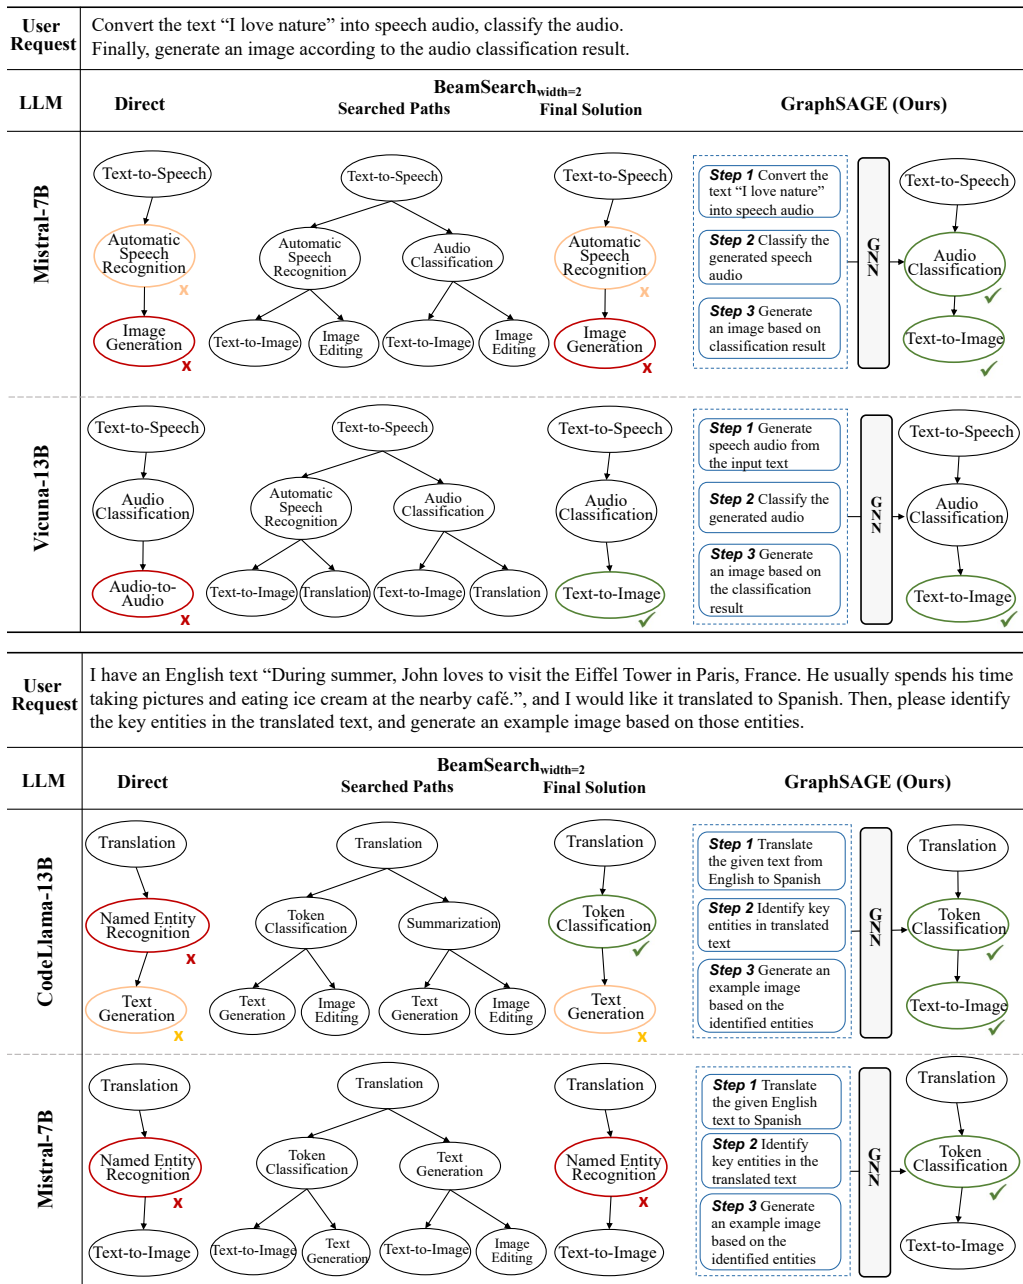

Figure 9: **Case Study of GNN’s Effectiveness.** Nodes colored in pink and red denote wrongly predicted task or hallucinated task, respectively. Due to space limitations, we only show the first four valid searched paths of BeamSearch for illustration. Even though LLM can explore ground-truth paths during searching, they **lack certain instruction-following and reasoning abilities to consistently choose the optimal path**. On the contrary, GNN can correctly align decomposed steps with suitable tasks, **hitting the ground-truth result**.
