

Instructions

User request have a graph, it is saved on the dataset file: NCI1. In the NCI1 dataset, each graph represents chemical compound, there compound and edges represent the chemical bonds between atoms. Node attributes can include chemical properties such as atom type (e.g., carbon, oxygen, nitrogen) and degree (number of bonds). For example, I want to find one GNN atoms or compounds, I want to find one GNN that has better accuracy.
