

Instruction (Graph Caption)	LLaMA2 Output	InstructGraph Output	Reference
You are a good graph reasoner. Give you a graph language that describes a graph structure and node information. You need to understand the graph and the task definition and answer the question. \n""\nGraph[name='wikipedia-knowledge-graph']\n\n entity_list = ['clown beetle', 'euspilotus cribrum', 'america', 'the family', 'species', 'histeridae'];\n\n triple_list = [('euspilotus cribrum' -> 'species')[relation='taxon rank'], ('the family' -> 'america')[relation='country']];\n\n""\n Task definition: given a knowledge graph with all entities and structure triples representing factual and commonsense knowledge. Please leverage this graph to generate an encyclopedia passage. Note that do not list all knowledge in a running account.\n\n Q: Please generate an encyclopedia passage for the knowledge graph.\n\n A:	The relation between Euspilotus cribrum and species is 'taxon rank', and the family country is America. [Human Evaluation]: This answer directly states each fact triple from the given graph separately. It is accurate but not natural and satisfied as a whole.	Euspilotus cribrum is a species of clown beetle in the family Histeridae which is found in North America. [Human Evaluation]: This answer naturally describes the factual knowledge. Overall, it is very similar to an encyclopedia document and makes the reading experience better.	Euspilotus cribrum is a species of clown beetle in the family Histeridae. It is found in North America.
Instruction (Graph Generation)	LLaMA2 Output	InstructGraph Output	Reference
You are a good graph generator. You need to understand the task definition and generate a graph language to answer the question. \n\n Task definition: given a passage, extract some corresponding structure factual triples from the passage to form a knowledge graph, and generate a graph language to describe the graph. Note that: 1) the graph is a directed graph and the name is 'knowledge-graph'. 2) The entities must be mentioned in the passage. 3) The candidate relation type must be one of 'publication date', 'country of origin', 'publisher', 'performer'. 4) The generated graph language should be a code-like structure, and the skeleton format can be expressed as the following:\n\n""\n\n Graph[name='knowledge-graph'] {\n\n entity_list = ['xxx', ...];\n\n triple_list = [('xxx' -> 'xxx')[relation='xxx'], ...];\n\n }\n\n""\n\n Passage: ""Bluesman' is the 12th original album of Tak Matsumoto, the guitarist of the Japanese music group B'z. It was released by VERMILLION RECORDS on September 2, 2020.""\n\n Q: Given you a passage, please generate a corresponding knowledge graph.\n\n A:	Graph[name='knowledge-graph'] {\n\n entity_list = ['Bluesman', 'Tak Matsumoto', 'B'z'];\n\n triple_list = [('Bluesman' -> 'Tak Matsumoto') [relation='performer'], \n\n ('Bluesman' -> 'B'z') [relation='performer'], \n\n ('Tak Matsumoto' -> 'B'z') [relation='performer'],\n\n ('Tak Matsumoto' -> 'VERMILLION RECORDS') [relation='publisher'];}\n\n [Human Evaluation]: This answer sometimes contains wrong triples or missing some entities.	Graph[name='knowledge-graph'] {\n\n entity_list = [Bluesman, Tak Matsumoto, B'z, VERMILLION RECORDS, September 2, 2020];\n\n triple_list = [(Bluesman-> September 2, 2020) [relation='publication date'], (Bluesman-> Tak Matsumoto) [relation='performer'], (Bluesman-> VERMILLION RECORDS) [relation='publisher'], (Bluesman-> September 2, 2020) [relation='publication date'], (Bluesman-> Tak Matsumoto) [relation='performer'];\n\n }	Graph[name='knowledge-graph'] {\n\n entity_list = [country of origin, performer, publication date, Bluesman, publisher];\n\n triple_list = [(Bluesman-> Japan) [relation='country of origin'], (Bluesman-> VERMILLION RECORDS) [relation='publisher'], (Bluesman-> September 2, 2020) [relation='publication date'], (Bluesman-> Tak Matsumoto) [relation='performer'];\n\n }
